

Guiding our clients to a brighter future

Providing expert support for all your Intralogistics needs

With a wealth of industry experience, and a pragmatic approach to consultancy, our objective is to design and deliver agile, cost effective solutions to our clients, to ensure that their business is fully fit, ready to meet the challenges of a competitive world.

Experience

We have been designing automated systems for Distribution Centres, Fulfilment Factories and Parcel Sortation Hubs for over 28 years, providing technical support and guidance to many blue chip clients across in the UK, Europe and beyond.

Solution Architect

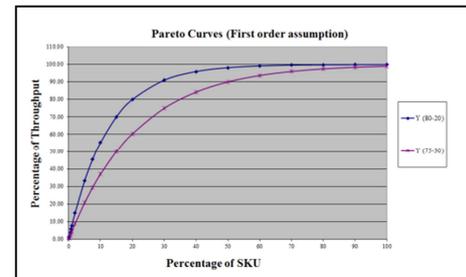

Our role as Solution Architect is to provide expert support to our clients, leading them through the various stages of project development, providing focussed assistance; allowing our client to concentrate on the daily needs of their business, and setting in motion a well proven process to deliver the best, most cost effective solutions to keep them ahead of the competition.

Operational Review and Analysis

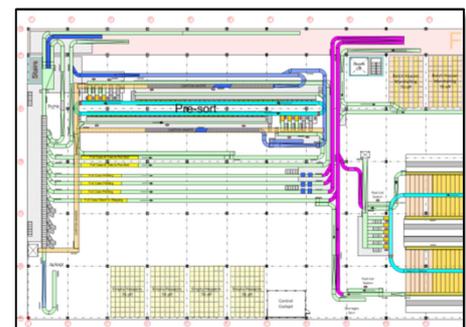

Good decisions are based on good intelligence so before the designing starts, it's essential that you first know where you are.

Corelogix have the experience to quickly review operations and data and evaluate these against the key future goals. Working with our client we will identify and resolve constraints and formulate and test new operational strategies to transform the business to meet the challenges ahead.

Solution Design

With the operational strategy tested, agreed and in place, the next stage is to translate this into a physical infrastructure design. Utilising our experience of logistics systems we will develop a “base scheme” to ascertain the footprint required, the interfaces with the building structure and allow operational issues to be evaluated. If the solution is to be put out for tender, we recommend that a “vanilla” design is created to allow bidding suppliers and integrators to be innovative, therefore not precluding specialist “niche” solutions that may suit the requirement well and deliver additional benefits.

In parallel with the physical design process is the development of the controls and management interfaces specification/requirements.

Providing expert support for all your Intralogistics needs

Procurement Support

With a background based within the “supplier” environment, working with, leading integrators and suppliers, we have a thorough understanding of their equipment, its use, strengths, weaknesses and idiosyncrasies. Furthermore we have a clear insight into how they work and what information they need to deliver the best results. During the “Bid Development Phase” we work with all bidders and use this knowledge to tease out the best designs, allowing them to use their assets to the best advantage and motivate them to fight to win the job. The benefits delivered at the “Bid Return” stage are an increased number of higher quality, competitive bids, giving our clients a greater range of viable options to choose from.

Supplier selection

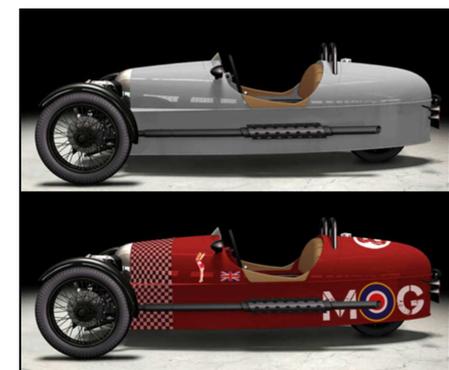

By encouraging suppliers to innovate as they develop their bid package, the task of selecting the best solution can become more difficult as you are no longer measuring apples against apples! By applying a methodical approach to bid evaluation, scoring each bidder across a range of criteria, it becomes easier to determine which package delivers the best results for your business. Additionally, this approach provides a clear audit trail, showing how the bids were scored and the decision made.

Implementation

As a result of the close monitoring during the bid development phase, final modifications and adjustments should be minimal and generally captured as part of the final negotiation, providing tighter cost control and limiting variations to a minimum.

Corelogix can provide project management and/or technical support during the implementation phase to ensure that the expectations raised during the earlier phases are fully met.
